Systematic Map Codebook — FT-R1a

ILRI / Bristlepine Resilience Consultants — 2025–2026

Where to find everything

→ Open the FT-R1a folder on Google Drive

What	Where
Papers to code	`FT-R1a pdfs/` subfolder inside the Drive folder above
Blank coding sheet	`coding_ft_r1a_XX.csv` inside the Drive folder
Your completed sheet	Save as `coding_ft_r1a_INITIALS.csv` (e.g. `coding_ft_r1a_AZ.csv`) and upload back to the same folder

---

How to code

1. Download `coding_ft_r1a_XX.csv` and save a copy as `coding_ft_r1a_INITIALS.csv`
2. Open each paper from the `FT-R1a pdfs/` subfolder
3. Fill in all 16 fields for each paper — one row per paper
4. Enter your initials in `coder_id` — same initials on every row
5. Upload your completed file back to the Drive folder when done

Rules:

- Code independently — do not discuss with the other coder until instructed
- If a field is not reported in the paper: leave blank or enter `not_reported`
- If you are unsure: make your best judgement and add a note in the `notes` column

---

Inclusion criteria

These papers are a calibration sample for the systematic map. Read each paper and confirm it meets **all five criteria** below. The paper must satisfy ALL five — if it fails any one, note the reason in `notes`.

---

1. Population

Include if: Individuals or households engaged in small-scale agricultural production (crop, livestock, fisheries/aquaculture, agroforestry) in an LMIC. Also include marginalized producer groups (women, youth, landless farmers, indigenous peoples, ethnic minorities, migrant/seasonal workers).

Exclude if: Large-scale commercial agriculture, agribusiness without smallholder focus, or non-agricultural livelihoods only.

When in doubt: - Mixed samples (smallholders + larger farms): INCLUDE if smallholders are mentioned and analyzed - “Farmers” in LMIC contexts without explicit “smallholder” label: INCLUDE unless clearly commercial scale - Industrial or corporate agriculture: EXCLUDE

---

2. Concept (Adaptation)

Include if: Study assesses or documents adaptation processes (learning, decision-making, adoption, participation, behavior change) OR adaptation outcomes (productivity, income, livelihoods, wellbeing, resilience, risk reduction).

Exclude if: - Climate impacts/vulnerability assessment ONLY (no adaptation action measured) - Mitigation only (reducing emissions) - General development or agronomy without explicit climate risk framing - Purely theoretical or conceptual (no intervention or measurement described)

When in doubt: - Adoption/uptake of climate-smart agriculture or water management: INCLUDE - Livelihood diversification in response to climate stress: INCLUDE - Vulnerability index or risk score without coping/adaptation responses: EXCLUDE - Farmer awareness/perception of climate change alone: EXCLUDE

---

3. Context (Climate + Agriculture)

Include if: Agricultural setting (crop, livestock, fisheries, agroforestry) with explicit climate hazard link — drought, flooding, temperature extremes, rainfall variability, or other climate stressors affecting production.

Exclude if: - Non-agricultural sector - Agricultural study with no climate dimension - Climate mentioned only as background (not driving the research question) - Agricultural impacts/responses unrelated to climate

When in doubt: - “Water scarcity” or “aridity” in semi-arid regions (implies climate): INCLUDE - “Food insecurity” in LMIC rural contexts with adaptation responses: INCLUDE - Generic “livelihood change” in non-climate context: EXCLUDE - Agriculture + environmental change (without climate specificity): EXCLUDE

4. Methodology

Include if: Study describes, evaluates, or applies a measurable method or framework to assess adaptation (indicators, metrics, surveys, qualitative interviews, participatory assessments, models with empirical data). Published between 2005–2025.

Exclude if: - Purely theoretical/conceptual (no method or data) - Systematic reviews, meta-analyses, or literature reviews - Pre-2005 publication - Opinion pieces or policy briefs without empirical method

When in doubt: - Narrative case study of farmer adaptation: INCLUDE (qualitative empirical method) - Agent-based model with survey calibration: INCLUDE (model + data) - Pilot application of an adaptation tool: INCLUDE - Crop variety trial without farmer adoption analysis: EXCLUDE

---

5. Geography

Include if: Study conducted in one or more Low- or Middle-Income Countries (LMICs) or Global South countries. Single or multi-country studies OK if at least one LMIC is involved.

Exclude if: OECD high-income countries only (USA, UK, EU, Australia, Canada, Japan, South Korea, etc.) with no LMIC component.

When in doubt: - China (all provinces): INCLUDE (upper-middle-income) - South Africa: INCLUDE (upper-middle-income) - Multi-country study (e.g. Peru + Germany): INCLUDE (Peru qualifies) - Brazil, Vietnam, Thailand, Iran: INCLUDE (all are LMIC)

Quick reference

Field	Valid values
`publication_type`	`journal_article` `report` `working_paper` `thesis` `other`
`geographic_scale`	`local` `sub-national` `national` `multi-country` `regional`
`producer_type`	`crop` `livestock` `fisheries_aquaculture` `agroforestry` `mixed` `undefined`
`marginalized_subpopulations`	`women` `youth` `people_with_disabilities` `landless` `indigenous_peoples` `ethnic_minorities` `migrant_seasonal_workers` `other` `none_reported`
`adaptation_focus`	**free text**
`process_outcome_domains`	`knowledge_awareness_learning` `decision_making_planning` `uptake_adoption` `behavioral_change` `participation_coproduction` `institutional_governance` `access_information_services` `yields_productivity` `income_assets` `livelihoods` `wellbeing` `risk_reduction` `resilience_adaptive_capacity`
`indicators_measured`	**free text**
`methodological_approach`	`qualitative` `quantitative` `participatory` `modeling_with_empirical_validation` `experimental`
`purpose_of_assessment`	`research` `project_learning` `program_evaluation` `donor_reporting` `national_reporting`
`data_sources`	`surveys` `administrative_data` `remote_sensing` `participatory_methods` `secondary_data` `other`
`temporal_coverage`	`cross_sectional` `seasonal` `longitudinal` `repeated_cross_sectional`
`cost_data_reported`	`yes` `no`
`strengths_and_limitations`	**free text**
`lessons_learned`	**free text**

The 16 coding fields

1. `publication_year`

Year the study was published. If multiple versions exist, use the most recent.

Valid values: integer — e.g. `2021`

---

2. `publication_type`

Value	Meaning
`journal_article`	Peer-reviewed journal
`report`	Project/programme report, evaluation report, policy brief
`working_paper`	Pre-publication working paper or discussion paper
`thesis`	PhD or master's dissertation
`other`	Book chapter, conference paper, dataset paper

---

3. `country_region`

Country or countries where the study was conducted. Use a region label only if no countries are named.

Format: free text; separate multiple entries with semicolons

Examples: `Tanzania` | `Ghana; Mali; Burkina Faso` | `East Africa` | `Global`

---

4. `geographic_scale`

Value	Meaning
`local`	Village, community, single site
`sub-national`	District, province, region within a country
`national`	One country
`multi-country`	Two or more specific named countries
`regional`	Broad region without country-level focus

---

5. `producer_type`

Select all that apply; separate with semicolons.

Value	Meaning
`crop`	Crop farming systems
`livestock`	Livestock farming systems
`fisheries_aquaculture`	Fisheries or aquaculture systems
`agroforestry`	Agroforestry systems
`mixed`	Explicitly mixed crop-livestock
`undefined`	Generic “smallholder farmers” with no production system specified

Where to look: Look in the Abstract and Introduction: Authors usually state their target population and main agricultural focus right away. If not, check the Methods / Study Area / Site Description sections: This is the most reliable place to look, as authors must describe the economic and agricultural baselines of the communities they are surveying.

---

6. `marginalized_subpopulations`

Code only what is **explicitly stated** in the paper — do not infer. Select all that apply; separate with semicolons.

Value	Meaning
`women`	Women explicitly targeted or gender-disaggregated analysis
`youth`	Young farmers or age-disaggregated outcomes
`people_with_disabilities`	Persons with disabilities explicitly named
`landless`	Landless households or tenure-insecure groups
`indigenous_peoples`	Indigenous communities named
`ethnic_minorities`	Ethnic minority groups named
`migrant_seasonal_workers`	Migrant or seasonal agricultural workers
`other`	Any other marginalised group explicitly named — add a note in `notes`
`none_reported`	No marginalised groups mentioned

Where to look: Look in the Abstract and Introduction: Authors often state right away if their study specifically targets or evaluates a vulnerable subgroup. If not stated, check the Methods / Sampling / Study Area sections: This section details exactly who was surveyed and how they were chosen. Look for

descriptions of “purposive sampling” criteria, such as deliberately selecting participants based on “gender (if known) and/or youth”.

---

7. `adaptation_focus` *(free text)*

The specific climate adaptation action, intervention, or practice the study tracks. Write 5–15 words based on what the paper describes.

Examples: - `crop varieties and genetics` - `water management and irrigation` - `climate information and advisory services` - `livelihood diversification (non-farm)` - `agroforestry` - `livestock management` - `financial strategies` - `social and community networking`

Where to look: Look at the Abstract and Introduction: Authors usually highlight the primary interventions or adaptation strategies they are investigating right away. The Methods / Interventions / Study Design sections: This is where authors detail the specific strategies tested, promoted, or surveyed in the study. Results and Descriptive Statistics (Tables): Look for tables detailing adoption rates, summary statistics, or regression variables, as these will list the exact practices tracked. Discussion and Conclusion: If the study is a modeling or vulnerability assessment that doesn’t test a specific intervention, the authors will often propose an adaptation focus in these sections. The Appendix / Survey Instrument: If the researchers include their questionnaire, it will show the exact adaptation options they asked farmers about.

---

8. `process_outcome_domains`

What the study measures. Select all that apply; separate with semicolons.

Rule: Code only domains that are **explicitly measured** — not domains that could be inferred. If the paper measures yield but not income, code `yields_productivity` only.

Value	Meaning
`knowledge_awareness_learning`	Awareness of climate change, knowledge of options, learning outcomes
`decision_making_planning`	Farmer decision-making, use of forecasts in planning
`uptake_adoption`	Rates of adoption of a practice or technology
`behavioral_change`	Changes in farming or land management behaviour
`participation_coproduction`	Participation in programmes, co-design, farmer group engagement
`institutional_governance`	Policy uptake, institutional change, governance
`access_information_services`	Access to extension, credit, markets, climate information
`yields_productivity`	Crop yield, livestock productivity, fish catch
`income_assets`	Household income, asset accumulation

Value	Meaning
`livelihoods`	Food security, livelihood diversification
`wellbeing`	Health, nutrition, subjective wellbeing
`risk_reduction`	Reduced exposure or sensitivity to climate shocks
`resilience_adaptive_capacity`	Adaptive capacity indices, resilience scores, vulnerability indices

Where to look: Look in the Methods / Variable Descriptions / Summary Statistics (Tables): Authors will list the specific process indicators they tracked in these sections. Also check the Results / Findings sections: Qualitative and quantitative changes in knowledge, learning, and participation are reported here. Discussion and Conclusion: Authors often interpret how an intervention affected social processes, learning, or institutional dynamics in these sections.

---

9. `indicators_measured` *(free text)*

The specific indicators or metrics used. Extract from the methods or results sections. Include units where stated.

Examples: - `yield (t/ha), income (USD/season), food security score (HFIAS)` - `adoption rate (%), area under improved variety (ha)` - `climate resilience index score`

---

10. `methodological_approach`

Select all that apply; separate with semicolons.

Value	Meaning
`qualitative`	Qualitative research design (interviews, focus groups, ethnography)
`quantitative`	Quantitative research design (surveys, statistical analysis)
`participatory`	Only when participation is the **primary** design (PRA, photovoice) — not when farmers are merely surveyed
`modeling_with_empirical_validation`	Crop/climate/agent-based models validated with field data
`experimental`	RCTs, natural experiments, quasi-experimental approaches

---

11. `purpose_of_assessment`

Value	Meaning
`research`	Academic study with no programme affiliation
`project_learning`	M&E embedded in an ongoing project
`program_evaluation`	Formal evaluation of a completed programme
`donor_reporting`	Report produced for a donor or funder
`national_reporting`	Contributing to NAPs, NDCs, or national monitoring frameworks

Where to look: Look in the Abstract: Authors typically provide a high-level summary of why the study was conducted right at the beginning of the document. Also check the Introduction — this is the most reliable place to look. Standard academic writing conventions dictate that authors explicitly outline their goals, objectives, or research questions at the very end of the introduction section, right before diving into the methodology. The Conclusion / Summary: Authors often briefly restate the core purpose of their assessment in the concluding section when summarising what their study ultimately set out to achieve and what it found.

---

12. `data_sources`

Select all that apply; separate with semicolons.

Value	Meaning
`surveys`	Primary household or farm surveys
`administrative_data`	Government or programme records
`remote_sensing`	Satellite or aerial imagery
`participatory_methods`	PRA, focus groups, photovoice as a data source
`secondary_data`	Existing datasets, literature, or other secondary sources
`other`	Any data source not listed above

---

13. `temporal_coverage`

Value	Meaning
`cross_sectional`	Single point in time or single season
`seasonal`	Intra-annual, across one or a few seasons
`longitudinal`	Multi-year, panel data, repeated measures with the same individuals

Value	Meaning
`repeated_cross_sectional`	Multi-year, repeated measures with different individuals each time

Where to look: The Methodology / Data Collection / Study Design sections is the most definitive place to find temporal coverage — authors must detail exactly when and how often they collected their data. Also check the Data and Variables / Climate Modeling sections: If the study relies on secondary data, historical records, or predictive modeling (rather than field surveys), these sections will define the exact time periods analyzed.

---

14. `cost_data_reported`

Value	Meaning
`yes`	Paper explicitly reports cost figures or cost-effectiveness ratios
`no`	No cost data — a qualitative mention of “limited resources” counts as `no`

---

15. `strengths_and_limitations` *(free text)*

Author-reported strengths and limitations. Look in the Discussion, Conclusion, and Limitations sections. Extract verbatim where possible.

Format: `Strength: <text>. Limitation: <text>.`

---

16. `lessons_learned` *(free text)*

Key lessons or recommendations the authors report. 1–3 sentences. Focus on what they say should be done differently — not the findings themselves. Enter `not_reported` if absent.

Where to look: Look at the Discussion section: This is the primary area where authors interpret their results, explain why certain interventions worked or failed, and extract practical insights. The Conclusion (or specific “Implications” and “Recommendations” subsections): Authors consistently use the final sections of the paper to synthesise their overarching lessons for policymakers, donors, or future researchers. The Abstract (Final Sentences): Authors frequently distill their most critical lesson learned into the final lines of the abstract.
